

The 1917 October Revolution

Salah Abu Fideh

Abstract

From the late 19th to the early 20th century, Russia underwent a historic revolution led by the Bolsheviks, who opened the Russian empire's vast ruling class. It proved crucial in history, with a turning point in the development of Russia, mainly, the revolutionary features of deepened and long-lasting social, political, and economic transformations within the Soviet regime, which were only completed by the rapid industrialization and widespread literacy that the Soviet regime manifested by. The long-running and critical issues of the Russian empire and the role of the Bolsheviks in power was ultimately dealt with it came dramatic and radical changes in the political, economic, and social structure of the country, including the establishment of a new state, the creation of a new social order, and the implementation of a new political system. This long-lasting revolution led by Vladimir Lenin and the Bolsheviks party, fundamentally and radically changed the structure of Russian society, history by dismantling long-held oppressive systems and creating a new, socialist society, establishing a self-proclaimed socialist state, the first of its kind. This article examines the social and economic conditions as well as the challenges of the revolution, focusing on the transformation of the political, economic, and social structure, and long-term implications for global revolutionary movements. Through an examination of the years of 1917-1932, the article highlights the revolution's crucial role in challenging existing power structures and its influence on the history of world history as well as the future of Russia in the 21st.

Keywords: Vladimir Lenin, Bolsheviks, Russian Revolution, Marxism, Communism

Introduction

The October Revolution of 1917 was a critical moment not only for Russia but for world history, as the revolution achieved victory over an oppressive regime ruled by the bourgeoisie ruling class, which created a road to the rest of the world. As in Marx and Engels predicted, the working class, peasants, and revolutionary intellectuals all gathered upon the banner of the revolution. This is a historic moment of revolutionary, economic, cultural, and political changes, establishing a socialist state, the Soviet Union, to pursue capitalism and communism (John B. Stoyan, 1945) (Stoyan et al., 2015). The article focuses on the social, economic, and political changes of long-standing and deep social transformations within the social, political, and economic structure of both capitalism and the Soviet regime which were only completed by the rapid industrialization and widespread literacy (Pipes, 1990).

Being led by Vladimir Lenin and the Bolsheviks, the revolution radically changed Russian society, dismantling social structures and ushering in a new era of revolutionary democracy (Pipes, 1990). As noted by the scholar, this

medium will discuss the nature and consequences of the revolution with a focus on the crucial role of the proletarian in reshaping political and economic landscapes all over the globe. From Cuba to Vietnam (Hobsbawm 1977) as the hegemonic applications for global revolutionary movements (Tarrow, 1988), serving as a form of hope giving that is essential through its commitment of the revolution of 1917-1922. This study will call attention to the revolution's global reputation of challenging existing power structures, both globally and domestically, the influence on the trajectory of world history, as well as the impact on the lives of thousands of the poor, and how their quality of life changed as a consequence of the nature of revolution (Tarrow, 2009).

The Role of Class Consciousness in Revolutionary Transformation

The Russian Revolution highlighted the relevance of Marx's theory of class consciousness, the changed and reborn version of Marxist theory after the experiences of the Paris Commune of 1871, showing it as a revolutionary, radical, and transformative popular political movement. Lenin and Trotsky's evaluation of the Russian party was key in maintaining the proletarian revolutionary potential, including the working class and peasants to integrate their oppressed position in capitalist society to work for better life through the knowledge of being oppressed. They not just fought to fight back against it (Lenin, 1983). By systematically and clearly locating the ideological hegemony held by the bourgeoisie, metaphorically burning the chains of the proletarian revolutionary proletarians, allowing the emergence of class consciousness in the realm of proletarians and other working in the proletarianism (industrial class workers) life is demonstrating with conviction (Hobsbawm, 1977) (Marx & Engels, 1848).

The proletarian demonstrated how economic consciousness, which are ideologically driven, a revolution created the conditions for revolutionary change. However, as Marx described the proletariat is ever-changing, ever-changing, because they demonstrated within capitalism can be easily changed as they are constantly being re-fashioned. Revolutionaries are what give change for revolutionary change. Rapid industrialization had mechanically constructed modern civilization, increasing their pay, drove more toward working workers only sped up the process of industrial organization and political consciousness that would ultimately challenge the status quo, including the bourgeoisie (Hobsbawm, 1977). This process included labor's discontent, proletarian view of historical transformation, where all of history is based on class war and differences, often inevitable revolution (Hobsbawm 1977) world and political developments.

The Materialist Premises of Revolutionary Change

The Russian Revolution provided a concrete rejection of the extreme idealist criticisms of Marx's theory of historical materialism. The historical materialism – the material conditions and societal relations are the base upon which all social, political, and ideological structures are built – has powerfully expressed at the revolutionary times of 1917-1922. The historical contradictions between the rapidly developing forces of production and the outdated relations of production had caused social contradictions to arise, which Lenin, exactly as Marx had anticipated in his critique of capitalism (Lansky, 1919). These contradictions appeared in the early modern industrial context against a war, represented worldwide with armed uprisings, social relations.

Lenin's insight and analysis of the social and political developments proved particularly insightful, recognizing that the industrial revolution had created the conditions for revolution. Russia represented a unique case where advanced industrial capitalism existed alongside extreme feudal structures (Lenin, 1917). This position

developmentalist ideas (Tinker, 1977) issued a "privilege of lowest-class actions," whereas Hobsbawm (1989) views stages of capitalist development and more straightforward socialization. The central struggle (the Soviet–U.S. revolutionary class) was institutional, whereas military actions in World War I exposed the regime's hypocrisy and nationalism. And industrialization helped avoid a capitalist final struggle, and the possibility of socialized production in the society was possible (Hobsbawm, 1989).

Industrial workers, concentrated in heavy factories like iron and steel, experienced a period of exploitation (period) in their most successful in the war after capitalist increased production while trying to stabilize industrial production. This concentration of workers—a direct consequence of Soviet rapid industrialization—created the national conditions for class solidarity and political organization as they were able to talk with one another about problems and the ruling class, facilitating the development of revolutionary consciousness (Tinker, 1977). Moreover, the great amount of resources (expensive) from over 80% of the population, which makes them the most important, had a great impact on the revolution through positive measures, such as health and education, creating a powerful revolutionary potential that the United States could not match (Hobsbawm, 1989). Through their process of "From Lenin and Stalin" (Tinker, 1977).

The revolution's impact on the Soviet Union was beyond economic factors to include the Russian Empire's progress and ideology. Soviet's vast territory and diverse population created governance challenges for the centralized Soviet state which increasingly provided space for revolutionary organization and movement. However, the revolutionary action of the government could not reach within their territory, so it is far too large. Thus, the revolution changed the country from a centralized government to a more complex federal structure that made the existing world order untenable and revolutionary transformation an inevitable consequence, facilitating Marx's revolutionary transformation of society (Williams, 1977).

Revolutionary Praxis and the Balance of State Power

The Bolshevik victory in 1917 represents a great lesson in revolutionary practice, the development of revolutionary theory and action (the Marxists emphasize throughout the works). Unlike other previous revolutionary movements, the Bolsheviks combined their sophisticated theoretical understanding with practical flexibility, allowing them to navigate the exceptionally complex political terrain of post-February Russia (Tinker, 1977). The revolutionary activity was established from clearly defined revolutionary goals, which demonstrated an extremely high level of discipline and unity in the face of extreme conditions and setbacks, and of the revolution's strong ideological, which were being right of the goal of production and power.

Lenin's adaptation of Marx's theory to Russian conditions was not a deviation from Marxism but its creative application to specific historical circumstances. As Marxism is not a one-size-fits-all religious belief of thought, it was made to change according to the conditions of time and space, which is why it is different from 180 years ago with back different in the 19th century than now. The theoretical revolution, particularly regarding the concept of power and the role of revolutionary consciousness, addressed the practical challenges of organizing a revolutionary movement in a semi-feudal society with a relatively small industrial proletariat (Tinker, 1977). The Bolshevik Party, organized according to the principles of democratic centralism, functioned as both a theoretical laboratory, allowing for people to make their ideas and beliefs to be tested and debated, and as an instrument of revolutionary action, capable of sustaining ideological cohesion while organizing leaders to rapidly changing circumstances (Tinker, 1977).

The Soviet model of a centralized of workers, which was power's changed in the organization.

methodical revolutionary plans. These discursive versions of proletarian self-government provided both a practical replacement for bourgeois parliamentary government that kept the system in the hands of a few select few rich and powerful people, and a theoretical model for the dismantling of the proletarian that Marx had envisioned (Kamukin, 1974). Through the slogan "All Power to the Workers," the Bolsheviks recognized and accepted the revolutionary potential of these institutions, establishing a basis for systematic revolutionary activity that continued despite the narrowly defined theoretical limitations.

The Bolshevik government itself recognized proletarian power is actual, rather than a theoretical potential option. It was a very careful and thought-out plan that operated directly by the Military Revolutionary Commission of the Petrograd Soviet, guided by Trotsky's systematic strategic willpower, which he is attributed to as the one, and only, political cause (Kamukin, 1977). The Bolsheviks' successful seizure of state power resulted from their ability to build strategic alliances with various sections and classes of the economy, effectively neutralize political opponents, and establish a compelling vision of revolutionary transformation that resonated with the masses' immediate material goals (Kamukin, 1974). This achievement validated Marx's assumption that proletarian theory results in radical change's revolutionary practice and that the working class does not as political power or structure social relations.

Conclusion

The Russian Revolution represents a shift in world history. It demonstrated that Marx's Framework, which was only spread through theory with no large-scale real-world experience, could be realized and not only that, but was also very effective. It showed that overthrowing the bourgeoisie by the organized proletarian was possible. As demonstrated in this paper, this transformation was inevitable for Russia, given the long-standing specific material conditions within society. The contradictions between developing proletarian forces and capitalist technological production that Marx's Framework illustrated as inevitable for revolutionary change. The Bolsheviks' actions only further validated their theory. It would push many other proletarians in several other countries to push for their revolution and overthrow of their bourgeoisie class like China, and a fully proletarian social system within the USA.
