ABSTRACT

1. INTRODUCTION

In this paper, we review the state of the art in Bayesian inference for learning models. We discuss the challenges of learning models in the context of the Bayesian framework, and the role of the Bayesian framework in learning models. We also discuss the role of the Bayesian framework in learning models.

Learning is a process of inferring the structure of a model from data. In the Bayesian framework, learning is a process of inferring the parameters of a model from data. The Bayesian framework provides a principled way to learn models, and it is the foundation of many machine learning algorithms.
