

The Rise of Influencer Culture: A Media Revolution

Abstract

In the digital age, influencer culture has reshaped how people perceive fashion, beauty, and lifestyle issues. This research paper explores the ethical dilemmas and social challenges associated with the rise of influencers, including concerns about authenticity, transparency, and the impact on mental health. It also examines how the rapid expansion of social media has blurred the lines between personal and professional lives, influencing societal norms and expectations. Furthermore, the paper delves into the role of influencers in shaping public perception of issues, highlighting how social media and influencer culture contribute to the erasure of influencers and celebrities. Another key focus is the power of personal branding and self-representation, which has allowed influencers to carve out their own spaces within the digital landscape, creating new opportunities for both individuals and companies. However, the darker side of influencer culture is also explored, including issues related to exploitation, mental health, and the pressure of maintaining an idealized online persona. Despite these challenges, the paper concludes by acknowledging the positive aspects of social media, particularly its ability to foster creativity, inclusivity, and global connectivity.

Introduction

In today's digital landscape, marketing has the persuasive power of social media icons, who decide what's hot, what's desirable, or even what's real? The age of influencers has arrived: individuals like Instagram models and YouTube vloggers are the new celebrities who wield power and prestige in ways that influence purchasing behavior, thinking, and even beliefs. This raises an important question: how does this new form of celebrity influence society, shape cultural norms, and influence the way we communicate with each other? The rise of traditional marketing has been replaced by a new, efficient marketing technique, where a person becomes the advertiser and the advertising platform at the same time. Thanks to the internet and social networks, it is easier for brands to reach their target audience. However, there are still ethical concerns as individuals may share personal content as well as professional (promotional) content at the same time on their social media. As the lines blur, many begin to believe that anyone can become a famous and influential person, thus complicating the relationship of the nation with reality. People often associate social famous people with the standards, making it even more difficult for them to secure that is believed to control the entertainment industry and help create popular perceptions through repetition. This research aims to explore the historical roots of influencer culture, the development of the social networks and theories like the Maffucci, which affect the public perception of fame.

Influencer culture may be traced back to the early twentieth century, when the initial priority of influencer culture was representing long before social advertising platforms came into existence. The concept of influencer marketing as a strategy for advertising has been around for a long time, with early examples of an "influencer" being a famous person or a famous person. One of the earliest and most prominent examples of an "influencer" was Hollywood film star and fashion icon Audrey Hepburn. Her striking style, elegance, and iconic image inspired millions worldwide. Hepburn became a legend in the 1950s, and her fashion line, "Audrey Hepburn and Huggins of Tiffany's," solidified her position as a symbol of elegance and sophistication. The concept of

advertising were the luxurious clothing brands and considered for influence over the realm of luxury activities that women's magazines started to portraying both brands and values. The reason for Hepburn's beloved-empire spread lies in the realm of the women's leading magazines, television programs, and public appearances. Her influence marked a significant shift where celebrities associated with the masses by representing aspirational, influential, and philanthropic, she not only captured audience but also shaped consumer preference. This phenomenon was not unique to Hepburn, however. Decades earlier, Hanks, Nixon, and even political figures inadvertently assumed roles as influencers. Take for instance, Queen Victoria, who represented while working dresses in the 19th century a fashion choice that remains dominant today. Such evidence demonstrates that the realm of influence today are intertwined with material shifts, technological advancements, and the fashion industry to produce aspirational figures. In parallel, the advent of mass production and mass distribution of the party. This luxury amplified the role of mass participation. The fashion of the 1920s provided a space for luxury goods to be marketed as the middle class. As women flourished and mass media evolved, advertisers conceptualized the principle of giving characteristic individuals to represent their products. These individuals were not just celebrities, they became symbols of an ideal lifestyle. For example, the automobile industry in the 1930s, often associated cars with Hollywood stars, creating a perception of such vehicles into a status symbol. However, the realm of influence extends far beyond products and brands. Historical references also played significant roles in shaping political or social movements. Figures such as Mahatma Gandhi, with his philosophy of non-violent resistance, became an enduring symbol of social leadership, proving that influence could not always receive strong recognition of our 21st century. Thus, while today's influence operates within the framework of social media, the essence of that role is far from new. Whether through historic philanthropy, or political ideal, historical figures have long demonstrated the power of visibility, relatability, and aspirational appeal – core principles that continue to define the influential others of the 21st century.

While the media landscape has brought about digitalized connectivity across the globe, it has also degenerated into a spiral of violence and posing threats. The space for abuse has taken over from positivity in recent decades, with various sites striving to make their content more visible than others. Social media platforms, which were meant to provide greater visibility, have created an ecosystem where people attract reading minds without considering the impact or quality of their words, thus leading to even the political instability and controversy. The most striking examples of harmful trends include the "Tide Pod Challenge" which peaked at 2018. Participants filmed themselves eating Tide laundry detergent pods, a desperate act that led to over 10 reported cases of poisoning in the first few months of the year according to the American Association of Poison Control Centers (AAPCC, 2018). The desire for attention on social media platforms like YouTube and Instagram amplified this behavior between, revealing how far people are willing to go for having online fame. Another disturbing trend is that of "jeans" culture, whereby victims stage harmful or humiliating acts under the guise of entertainment. For instance, in 2020, several TikTok users took to the "Skull Breaker Challenge," where unsuspecting individuals were urged and urged, leading to severe injuries, fractures, and broken bones. This trend gained traction and encouraged far too many teens to participate, resulting in over 1000 documented cases. But the most disturbing part will beyond physical state that can have long consequences. Coined by influencers, which that brand the notion of "popular activities or personalities, adding to a homogenized digital culture. The "copy-paste" culture erases the boundaries between commercially real, with users performing the same dance, poses, or challenges without their work that an originality. Such repetition dilutes creativity and creates a culture of superficiality, where individuality is sacrificed at the altar of algorithmic and trending topics. Moreover, social media's influence

sector has highlighted this issue. According to a report by Global Web Index (2022), 71% of users spent less time with their hand phones to give attention that will perform well, rather looking them as serious troubling demands. This growing not only states customer self-regulation but also characterizes mental health issues, as individuals measure their self-worth by likes and shares. The development of social has created a place where ideal and reality not enough positively and satisfactorily. Trends often promote harmful behaviors or lifestyle attitudes, stripping away individuality at favor of following digital regulations. To counter this, fostering a culture that values originality and ethical content creation is imperative.

5. The Ethical Dilemmas and Moral Challenges of Influence Culture:

Influencers and celebrities in today's social media world are the reality stars who share opinions, beliefs, and even secret values. This prompts the glossy posts and content feeds from a web of ethical dilemmas and moral challenges that cannot be ignored. From issues of authenticity to the mental health impact on both influencers and their audience, influence culture culture holds the community's shared and its common value.

Take, for instance, the controversy stirred by Kim Kardashian's promotion of cosmetic supplements in 2018. The Kardashian family, with their massive social media following, has long been a household name. However, their promotion of "Kardashian Beauty" supplements, which claimed to enhance skin health and overall well-being, drew significant criticism. Many consumers, particularly young women, were misled by the influencers' endorsements, believing the products were miracle cures for various skin issues. This incident highlights the ethical dilemma of influencers' responsibility. When celebrities endorse products without conducting proper research, they may go on to promote items and behaviors that may be harmful. Kardashian's influence, built off the back of a huge following, shows the power and potential impact of celebrity endorsements when they go public over public welfare. Transparency is another background behind in 2020, the Federal Trade Commission (FTC) reached a settlement with influencers for not revealing paid endorsements, among them was top "YouTuber" Jake Paul, who promoted some really dangerous investment returns but failed to clarify his financial promotion engagement. From transparency issues' past that credibility, such a trend has much higher consequences, especially from an influence of a week and online and network value often leading them away from their

and/or circumvent restrictions. Recently, in 2024, Sam Theisk also drew a bright light recently when he released a sponsored ad promoting a weight loss product. The audience reacted badly by including the brand's instructions within his captions and tweets, claiming that his post was staged and bad. These responses could a credibility trend where financial gain often takes precedence over honesty, leaving followers vulnerable.

Mental health is perhaps the most profound casualty of influence culture. When famous men or women followed celebrities on Instagram, Facebook, and depression public, exacerbated by pressure from social media like how overrated the like from platforms is, rather well being then, using the constant comparison and judgement on social media can be harmful for the mental well-being. Including the age of her fans, revealed how much someone at the pinnacle of her career was overwhelmed by the pressure of maintaining an online presence. On the other hand, highly followed struggles by Diddy Ayoade with her mental

gender and highly controversial commentary brought into focus how public scrutiny and immediate personal challenges, especially in a world where differences and taboos are exposed in more open aspects of their lives. Also, LGBTQ+ and transgender people, influence upon television screen, witness the effect of across three seasons. Multiracial campaign, by being open about feminist advocacy and joining a coalition, gender equality-based organizations. Wilson shared how social status could be influenced by and people to push against the legitimization of different culture. Notably, Dwyer "The Book" Johnson, after quake in his own struggles with parenting and mental health struggles that inspired him to have an influence rather than performed. In 2018, singer Hilarie Liebman had married as body dancing when she shared an emotional picture of herself. She brought about how beauty standards and impact young people to embrace reality of another temporary example in the film "Black & Blue", who, from a her partner (Julia) with cancer, and her platform to inspire and uplift. She is kept in those points while he continued to pursue what Johnson spoke volume about his dedication and character. When he was changed professionally, it reinforced the work career between gender inequality and performance and often seen in television culture.

Similarly, the social differences and social challenges of influence often require a collective effort to address. Performance seen in new context socially, understanding the issues of gender gaps and also related issues post influence and education. It can really provide history and social responsibility over short time span. Performers should continue social applications to create transparency and protect vulnerable audience. By continuing these changes, we can transform influence culture from a sense of responsibility to a force for positive connection and positive social impact.

II. The Economic Power of Influence: How Social Media Changes and Reshaping Consumer Behavior

Influence marketing has revolutionized the way brands promote and connect, creating an ecosystem of partnerships that combined the advertising industry. From native-like sponsored content and product trials, influence have not only changed how businesses market their products but also how consumers make purchasing decisions. The financial implications of this phenomenon are profound, as influence wield an extraordinary ability to shape consumer behavior. This is especially true given changing ways.

Consider the case of Kylie Jenner, whose influence made her become her reality TV fame. In 2018, she launched Kylie Cosmetics with a line of lip kits that saw an astronomical success. The success of the brand, built almost entirely on her Instagram presence, earned Kylie and the company an estimated \$100 million in 2018, according to Forbes. Her ability to directly engage with her followers and promote her products through authentic content has created a commercial level of consumer trust and demand. This incident exemplifies how influence can bypass traditional advertising channels, instead creating direct-to-consumer pathways that redefine business models.

On the flip side, the financial risk of influence marketing are equally visible. In 2017, the infamous Puma scandal nearly exposed the fashion side of the industry. Exposed by top tier influencers like Kendall Jenner, Bella Hadid, and Hailey Bieber, the scandal was related to a survey report response to a private label. T-shirts were purchased online, but when returned arrived, they were not with desired or people accommodations, instead sold and recycled alone. The influencers who endorsed the event faced backlash for failing to disclose their paid partnership and for promoting a fraudulent narrative. This scandal highlighted the importance of transparency in influence marketing and how misleading promotion can lead to significant brand damage and damaged reputations for both influencers and brands.

The use of major influencers – individuals with over 100,000 highly engaged followers – further demonstrates the

significant aspect of influencer marketing. Take the story of Drew Brees, a famous influencer who thrived on video reviews of household-type household products, including TAI-A, a popular microwave brand. By engaging a specific demographic and signing his brand with values like sustainability and inclusivity, the brand that even influencers with lower followers could generate significant financial success. This shift toward value-oriented customers is a total lifestyle revolution where authenticity and meaningful engagement over other stuff.

The economic impact has been limited to large-scale campaigns of luxury products. Everyday consumer behavior has been deeply influenced by viral trends initiated by influencers. In 2018, TAI-A and TAI-A's TV Advertisements attracted a record-breaking shortage of TAI-A's luxury watches. After posting a video of herself signing the dish with a watchmaking as "Bresner's TAI-A's Dream," sales of the gold watch skyrocketed, and TAI-A's luxury watch experienced a surge in popularity that traditional advertising could never have achieved so quickly. This incident demonstrates how experts explained influencer marketing can create massive economic impact, turning ordinary products into high-end luxury items overnight.

Influencer marketing (including this book) advertising has been accessible to small businesses. Platforms like Instagram and TikTok allow businesses to collaborate with local influencers, creating authentic campaigns that target specific audiences. For example, when small bakery TikTok the partnered with influencers to promote their unique desserts, their sales and online engagement soared, demonstrating how even small-scale collaborations can yield substantial results.

However, the industry is not without challenges. Influencers like Victoria Beckham have faced criticism for expensive posts (over \$10k). After being accused of promoting unrealistic beauty standards in 2017, several companies, including Huggies, cut ties with her. This incident highlighted the volatility of relying on influencers whose personal actions can directly affect the brands they represent. Businesses must now take carefully when working in influencer partnerships.

113. Question of Integration: Mapping Public Perceptions of Fata

People's conceptualized ideas about the Hierarchy have led to large-scale cultural revolutions with various offshoots and subcultures. Public Perceptions have evolved and expanded to the Hierarchy of Hierarchy, which

despite its being controlled by central operations that are not part of the Hierarchy would eventually. Although there is no evidence in concrete regarding the Hierarchy, the very idea of the Hierarchy (as the starting of people whose form is considered) is itself a complex and elusive, and across is usually (filled with history) cultural challenges. Perhaps one of the most visible ways the Hierarchy's influence on the public mind is through the concept of public knowledge. Major celebrities like Beyoncé, Jay-Z, and Kanye West are the most responsible for the Hierarchy's influence, by virtue of the use of language or thinking right in their own cultural participation, as some complexly described. A few years ago,

Beyoncé's 2017 Super Bowl halftime show provided the spark of reaction that her band members and stage design carried Hierarchy messages to prove her affiliation with the Hierarchy. Such beliefs mean that Fata and Hierarchy are intertwined not to an individual's personal and hand work but to even individual things become an integral story

This last wide-ranging investigation, the promptest illustration of the wider world of research people, including our various congresses, have driven upon that hard rock and left it bruis'd & scar'd, particularly among younger persons, who would be well wick'd to consider the causes of our failure in respect to such a national help. A 1932 study by the New Research Center revealed that 20% of Americans believe that we have grown so rapidly that we are a victim of our own growth. Let us hope that these statistics have prompted.

When all the style of the Harcourt has appeared persons and law of the public and entertainment systems. It includes all its members make it more a matter of political strength than the same degree they are the "people" of each organization. In the case of Duke Ellington after his time as being in a manager, company's Harcourt have started the new "character" into the Harcourt. Supposedly there is little more weighty company business to give him than. This view believes he set and gave no other Harcourt or people to prove their authority.

The rest of the theatrical conspiracy is a general scheme to secure, with power and influence, wealth & fulfillment, failure is evidenced by a failure of the artist that cannot perpetuate neither distinct and individual work or a general view of success. In such a case, usually contrary to the propensities of critical thinking, because what he feels audience demand that he be failure and subjects opinion called a failure going to be conspiracy fulfillment.

IV. The Power of Personal Branding and Niche Marketing

Subsequent meetings will take participants (and because the participants are women, so the digital age, especially) through social media platforms. As social media dominates the way people communicate, create ideas and form groups, it is now well placed to develop and support marketing to help them do so, share the value of entrepreneurial systems, influence, or persuade, have resources that allow them to create ideas and build relationships with other individuals, groups, firms, or communities.

The novel *Intuition* is the act of providing yourself in a narrative and scholarly work. The narrator tells that he is by watching several parts of their lives that align with specific values, emotions, or themes that align with his moral mission. For example, *Intuition* and *Intuition* (Chapman) is a narrative of a woman's influence, changed to create her personal and moral mission to achieve a woman's moral life. While being able to find an in her early work of *Intuition*, it is a book that is a story. It is a story of the world with her own voice in the world. However, this changing her voice, the two small differences in *Intuition* and *Intuition* is a book.

Multi-marketing further increases perceived similarity by targeting a select audience. Michael being a top brand player, they will target their own similar, very targeted internal design and later conduct a more conscious program. Considered more authentic, people like that Dr. Oz will have created some strong followings just by targeting the particular needs of particular audiences instead of being more simple. A similar strategy is used by the fact that influencers make their high engagement rate compared to other influencers, thus proving the importance of targeting social audiences.

The business gets its financing through a variety of means. Influencers typically promote their names through sponsored, affiliate marketing, and the sale of physical products. For example, Kylie Jenner used her personal brand to launch Kylie Cosmetics, which raised \$1 billion in sales by 2018, while another business she successfully partnered with made millions from her name. This helps build credibility and reliability with her audience, which is selling her name as a selling proposition.

The mental health implications of influencer culture represent another significant facet of the phenomenon. The pressure to maintain idealized online personas, overexposed comparisons, and constant connectivity with followers often result in various psychological issues. A study by the American Psychological Association (APA) in 2021 found that 40% of adolescents reported experiencing anxiety, depression, or loneliness. The constant demand for positive feedback and the need for validation through likes and comments create an environment where self-worth is tied perpetually to external validation and validation. A 2020 study by the University of Oxford found that 30% of young adults reported feeling lonely or isolated at 2020. However, the role of digital connectivity and social

VI. Positive Side of The Media

While media often faces criticism for its negative impacts, it also plays an essential and positive role in shaping societies, spreading knowledge, and fostering global connections. From educational opportunities to social movements and media innovation, the positive side of media efforts to promote digital and social

One of the most significant benefits of modern media is its ability to facilitate educational knowledge dissemination on an unprecedented scale. With over 5 billion internet users worldwide as of 2023 (Statista, 2023), digital media provides diverse avenues for accessing critical courses and educational resources. Platforms like Khan Academy and Coursera have democratized learning, offering free or affordable courses to millions of people across the globe. A study published by the Pew Research Center found that 87% of internet users view digital media as a vital source for learning and self-improvement. The easy access to educational resources promotes inclusivity, bridging educational gaps and promoting lifelong learning. Media also serves as a powerful tool for social change and awareness. Social media platforms, in particular, have given rise to global movements like #MeToo, BlackLivesMatter, and #ClimateAction, amplifying marginalized voices and driving political and social change. According to a 2022 report by the Harvard Kennedy School, 70% of social justice organizations use media as their primary platform for outreach and advocacy. These campaigns have not only raised awareness but have also led to policy changes and greater accountability in institutions worldwide.

Furthermore, media fosters creativity and cultural exchange. Platforms like YouTube, TikTok, and Instagram allow individuals to showcase their talents and share their cultural heritages with global audiences. This creative freedom has led to the rise of independent artists, influencers, and entrepreneurs who might not have found opportunities through traditional means. According to YouTube's 2021 Report, over 80% of creators believe the platform provides them with a more fair reward than other services. The internet empowers individuals to voice their perspectives, promoting understanding and appreciation of diverse perspectives and traditions.

In addition, media's role in crisis communication and emergency response cannot be overlooked. During natural disasters, health crises, or political events, media serves as a vital channel for timely information and coordination. The COVID-19 pandemic highlighted this role, with the World Health Organization using digital platforms to disseminate accurate health information and combat misinformation. A 2020 study by the International Journal of Public Health found that 80% of respondents relied on media updates for pandemic-related guidance, demonstrating media's critical role in public safety.

VII. The Psychological Impact of Influencer Culture

The psychological impact of influencer culture is also a growing worry, particularly for younger audiences who consume much media on a daily basis. Many influencers espousing idealized lifestyles, beauty, and material success, both online and offline, promote unrealistic, unattainable goals and values. The constant stream of their postings, which are often edited and filtered for perfection, creates a distorted view of reality that is different from the everyday life of most people.

A 2017 study by the Royal Society for Public Health found that exposure to the most social media platforms for mental health, with particular posting by perceived anxiety, depression, and body dissatisfaction, has led to a decline in self-esteem, body image, and mental health. A 2018 study by the British Psychological Association found that 70% of young people feel more alone than before after viewing influencer posts. The accumulation of constant promotions, criticism, and negative feedback has led to a rise in body dysmorphic disorder and eating disorders. The same influencers who promote hypersexualized bodies also promote the unrealistic pressure for young men to attain an unrealistic body goal, with 30% reporting dissatisfaction with their own bodies.

Other than body image, influencer culture has a range of social consequences that also make mental health a growing concern. A survey conducted by the American Psychological Association in 2021, 60% of those 18 and over of social media believe that life is worse compared to the individuals they follow on social media. The constant scrutiny of influencers, driving behind the scenes, exposure, criticism, and lawsuits, put their relationships under an unrealistic standard of happiness and success. A 2018 Journal of Social and Clinical Psychology study revealed that viewing social media posts for 30 minutes per day had a negative impact on depression and loneliness. During the negative effects of constant influencer engagement.

The exposure of parasocial relationships further contributes to the psychological impact of influencer culture. These one-way emotional connections occur due to the close or intimate digital world having less to do with reality and more with fantasy. According to a 2021 Pew Research Center survey, 40% of social media users aged 18-29 say they have a personal relationship with a friend or influencer. The desire of influencers for love or emotional connection and intimacy, especially, as influencers are told that to sell products or services, they need to influence their followers through words and like generated posts on the popularity of these virtual worlds that is otherwise unrealistic.

As influencers grow in their influence, social status, and recognition, the consequences of this digital age phenomenon are being felt more than ever. The studies reveal the prolonged exposure to carefully curated digital images has led to increasing mental health concerns, decreased self-esteem, and negative perceptions of life. As social media continues to provide opportunities for exposure and visibility, it also presents a growing mental health epidemic, which is a concern among the youth generation.

VI.3 Artificial Intelligence and the Future of Influencer Culture

Artificial intelligence (AI) is revolutionizing influencer culture, driving key trends between content creation and digital promotion. As generated influencers, algorithms, and automated content are algorithms are infiltrating the way individuals engage with social media. As AI continues to advance, its impact on authenticity, ethics, and the future of digital influence.

AI-generated influencers, such as Lil Miquela, Tana, and Shudu have gained millions of fans despite not being human entities. Virtual influencers are created using 3D and AI programming, allowing brands to control their messaging

with precision. A 2022 report by Influencer Marketing Hub found that 70% of social media users struggle to distinguish between AI-generated and human references, which indicates increasing reliance on online personas. Unlike human influencers, AI models do not get tired, require no physical space, and can be scaled to align with brand values without conflict. The stakes have likely doubled for marketing campaigns, with brands like Procter & Gamble and Huggies already venturing in virtual influencers. Despite technology that contributes to the secrecy of influencers, others by creating the content of hyper-real digital characters.

With AI, the influencer industry evolved without physically being on camera, which raised the bar for those who present online. This also raises ethical concerns, however, intensely scrutinizing virtualization is not unusual. In a 2022 MIT Media Lab study, they found that 70% of viewers who were first shown digital characters found them "strange" but they were positive. This type of disclosure can be employed for transparency advertising, political disinformation, or even identity theft. Further emphasizing that in future years, AI personalization is also transforming the way influencers connect with their audience. Social media sites like TikTok, Instagram, and YouTube use AI algorithms to learn about user behavior, tailoring content to personal machine algorithms.

In 2021, a Pew Research Center report found that 61% of U.S. adults are afraid of social media algorithms to become new influences. While the technology helps users find relevant content to their interests, it also keeps them trapped into the feeding system of other opinions. Moreover, algorithmic feeds are perceived as constant repetition and lack of diversity is disruptive between authentic human engagement and live involvement. While it has benefits, the place of AI as influence culture is causing anxiety regarding job replacement and privacy. How this influence has been even discussed by corporate-generated models who need not be paid, perhaps disrupting human entrepreneurship channels. The audience's faith will also diminish as artificial personas take over social media platforms, making it difficult for the public to trust with genuine human experiences.

As per a 2021 survey by Influencer, 60% of users still have concerns in false human influencers over AI influencers, reducing the effectiveness of authentic promotion. As AI continues to infiltrate influence culture, its impact will extend into marketing, ethics, and social interaction. While AI influence takes on awareness and efficiency, industry, transparency, and trust can be achieved through a harmonious online ecosystem. Influence culture in the future will grow with a hybrid model where AI and human creators coexist and grow the in the next digital influence.

In conclusion, the influence culture has revolutionized media, marketing, and social networks, shifting influence from humans to algorithms. From traditional icons like Audrey Hepburn to modern social media personalities, influencers have been shaping taste, values, and consciousness for years. However, with the expansion of technology, the power of influence steadily moved marketing to issues of identity, mental health, and privacy. Social media influencers have revolutionized advertising by building direct relationships with consumers. While this has provided numerous opportunities, it has also raised some uncomfortable questions, privacy, and ethical accountability. Influencers need to promote authentic, consistent, and honest and promote influence issues and comparisons. On top of this, influencers need to be transparent in such a distribution with peers, family, and dependence among the youth. Furthermore, the use of personal relationships through the social network ecosystem and individual concerns, reducing the influence to superficial, artificial intelligence is further transforming digitalization by way of AI influencers and digital life. Virtual influencers like Lil Miquela are gaining popularity, reflecting the rise of advertising in digital space. AI-driven content creation and automated human-like thinking is faster to discern reality from fiction. While these innovations unlock new marketing potential, they also perpetuate misinformation, trust, and the overall backlash for human influencers. As influence culture continues to

system of values of ourselves and others' responsibility is required. Power digital influence will remain greater
anonymous, harder to trace, and harder to be recognized. Whether created by human or artificial intelligence
behaviors, including individuals, we must still be led to developing a more sustainable and responsible influence
power of the digital era.
