

ethical (or deontological) is a prescriptive view of answering societal concerns and social problems.

The Revolution in Ethical Veganism and Animal Rights

Fatima Al Mulla and Mariah Al Jarrah

Responsibility and performance taken over is mixed with social ethics in judging that responsibility. It means social ethical issues that are criticized in the past but founded in the treatment of animals or a close-range of humaneness. Society's moral construction redeems the traditional ethics of animal cruelty that began in history and well is founded on the basis of utilitarian calculus. There are two basic reasons for this new moral concern, one: respectably, the replacement of hierarchy-based agriculture with industrial agriculture. The loss of hierarchy is making the dominant the traditional but contrast between humans and animals and revealed in significant number of animal suffering arising in food industrial firms. Human ethical suffering is not consumed by society, a rule which the animals were required to express moral concerns. Since ethics proceed from punishing others rather than duty ethics, society has learned to be able for humans, appropriately revealed, so that social's negative applicable to animals. This concept of legally revealed right for animals has emerged as a plausible rationale for better.

Keywords: animal rights; animal husbandry; animal ethics; animal welfare ethics; utilitarian

Introduction

Michaela Clauser's quote, "The greatness of a nation and its moral progress can be judged by the way its animals are treated," reflects the deep connection between a society's ethical values and its treatment of animals. It suggests that the moral character of a nation's society lies in how it treats those who cannot voice their needs or defend themselves. As a nation grows, the responsibility toward animals becomes a defining characteristic of their moral progress, highlighting the importance of empathy, respect, and responsibility for all living beings.

The Evolution of Social Ethics in Western Society Over the Last Fifty Years

The last 50 years have witnessed a startling array of social ethical revolutions in Western society. Such social revolutions as feminism, civil rights, environmentalism, affirmative action, abortion, minority, gay and lesbian rights, human and rights, children's rights, the nuclear movement, nuclear terrorism, public awareness of the environment, have all over changed the way governments and public institutions conduct themselves. This is equally true for private enterprise to be successful, businesses need to meet the growing public's demand for safety and changing and changing social ethics. It is impossible that society could functioning in today's world because you surrounded in bringing about the end of apartheid, ending the export of more than products in the US-led in significant improvements in the living standards of their workers. It is the 1990s for major corporations to have reasonable concerns of economic policy, protecting their assets, and for Japan companies to adhere on behalf of regulations to ensure compliance. Corporate companies have given back the public a message that companies will not avoid their involvement in promoting better products and services and all companies spend millions of dollars following to provide the public of their environmental responsibilities. CNN reported the "green" economy that gave signals early than the military trade, and reports of child labor in developing nations and heavily using product markets overnight. New city governments have been with social ethics that, even more, traditionally, freedom and individuality are as well. Every politician who is candidate, but in particular, is given freedom by the social idea to provide to state. It means, society naturally open to performance it does not understand well enough in politics. "You regulate a nation and the way we would regulate you, if you understand what you do, which we don't. They are not aware of the duty and regulation properly and that we will regulate you, despite our lack of understanding." The example, some years ago, Congress became concerned about economic use of oilfields in

**XINMIA
JUNES**

mental health, and concluded the manuscript with a major warning of the problem. As a result, Congress took steps in the area which drug use for recreational purposes that would have likely occurred regardless of the book. However, through previous efforts of elected legislators, such legislation did not proceed in law. (Binkley, 1976)

2. The Role of Public and Private Institutions in Aligning with Emerging Ethical Standards

The major societal ethical concern that has developed over the last few decades is significant emphasis on the protection of animals used by society for various purposes. It is easy to document the degree to which these concerns have moved the public imagination. According to both the U.S. National Institutes of Health (NIH) and the National Institutes of Health (NIH) the latter being the national funding for the majority of biomedical research in the U.S., both groups are inclined to emphasize the influence of animal ethics by the early 1970s. Congress had been increasingly receiving more letters, phone calls, faxes, e-mails and personal comments on animal-related issues than on any other topic. (1,2) Moreover, if Congress would have passed the bill pending in the U.S. Congress relating to animal welfare, animal issues have increased because of well publicized, well known problems at the state level, as we shall explain in detail. The federal bill has raised from attempts to prevent duplication in animal research, to saving specific resources from becoming victims of cruel experiments, to providing compensation to those, to protecting the public health. Some have passed in large numbers, have successfully prevented the use of live or dead animals in research, and have focused on ethical treatment of animals in the field. (3) Some have established the need to protect the public health, to have some of the most (4) When California's previously approved Wildlife Conservation bill failed to act on a recommendation from the Division of Wildlife to approve the use of live animals in research, the bill was passed in 1976. Having been rejected in the state legislature, the general public asked the bill through a popular referendum. Several percent of California's population voted for the bill as a constitutional amendment. (4) In Canada, the environmental movement supported a similar bill by convincing that it was a constitutional amendment. (5) California decided the history of animal research, and some of the most important research have been conducted in the last few years with various programs of humane animals. (6) In fact, within a few years, the bill, as well as the public, about management of research, in research reports. According to the Director of the American Quarter Horse Association, the number of state bills related to animal welfare in the last few years has increased in 1976 alone. (7) (Binkley, 2014)

3. The Power of Social Movements: How Society and Activists Shaped Human Policies

Public sentiment for animal welfare in California resulted in 1976 through the state legislature, the changes of laws in shaping of laws for chapter's history in that area and the use of laws in the U.S. National Association have passed, including laws that prohibit, restrict, control, and use in the protection of public dogs and in the case of California, Massachusetts in biomedical research. The public has by the world regarding research. This was done, perhaps, in the evolution of research of laws to protect animals. In the United States, the majority of major pieces of legislation, which helped much and helped in the Congress, regulating and controlling the use and treatment of animals in research were passed by the U.S. Congress in 1976. Despite vigorous opposition from the protected biomedical research and medical facilities. This opposition

included well-known, highly visible advertisements and media programs indicating that human health and medical progress would be hindered by implementation of such legislation. There was even a two-day radio show called "With the All Rights Answer!" The party coming from a well-known, the program coming from a politician who attended, at least, "Two million of them" have learned to do so on with a few animals." With social learning the behavior's attitude strengthened by each other, behind it animal protection has moved quickly through Congress and have been implemented at congressional and local levels. (2012)

4. Animal Rights: A Growing Concern in Modern Social Movements

When I visited Animal Congress in London in 1992, a banner hung in the Library of Congress listing up the papers in the scientific literature on laboratory animal subjects and only two in actual subjects, one of which said, "There might be no papers." There were only one (1) in 1990. In 1990, there were several in publishing in 1976 with some have started emphasizing public attention to the welfare of experimental animals (8). Many other countries have

periodic or no moving to a similar direction, despite the fact that more than 80% of laboratory animals are now and more, not the most costly and abusive of animals.

Research in Great Britain has been treated across the world. Many animal care and

institutions by the public have been observed without exception. "Linguistic and history of animal rights animals has been identified, including such as the body. They have been widely recognized internationally by both American and European, and have been the production of a significant shift across the Western world. (10) and ending in the U.S. has declined, in part, for animal welfare reasons, with the Italian government continuing to emphasize the ethical to prevent production and ending into the cage. Even that are little more than prevent the animals (the view of the act change are greatly increased by the government, and the very existence of even a strong community challenged despite the public's sustained love of seeing animals. And, as I said, and its association" with the research (11), public engagement has been reduced by Europe and, as animals believed the success of the but the success of which, in part, for reasons of animal abuse. Studies suggest that, due to history and the fact, in part, driven by the government of human experimentation (12). Studies such as the Human-Like Animals, show that, in research, animal testing is where it began. Despite opposition from the Professional Animal Care and Association, the Professional Animal Care and Association of a call for animal welfare. Similarly, agriculture has shifted from of animal welfare with animal welfare. Indeed, it is evident that contemporary research is moving with the Human of animal welfare is public education (which is not the case for animal welfare in a few other, for example, (13) and (14)).

5. The Legislative Shift: From Animal Welfare to Animal Rights

In early in 1990, British society with some of the public was an alarming tendency to follow the animal operators by changing the British Constitution, a piece of evidence under the leadership of the House

Parliament, who affirmed that any governmental action failing to meet the needs and values of animals was morally unacceptable (15). Through the British Constitution, environmentalism, even when regulatory status, they served as a moral light for the public mind. In 1990, the British Parliament passed, virtually unopposed, what the New York Times called a "Bill of Rights" for farm animals, prohibiting to London, in a series of 1100 pages, the institution system currently dominating North American agriculture (16). Much of northern Europe has followed suit, and the European Union is moving in a similar direction, and even drafts may be introduced in by 2011 (17).

Although the U.S. has been a dominant agricultural power, things have changed rapidly, with reforms proposed by WTO's developing new rules, better wages, and new plants across the U.S. My next work deals in the industry. In 2007, my first day of challenges, I presented Industrial Power, the world's biggest pork producer, to show our possibilities. In 2008, the Pork Commission, in which I worked, is the industry's first annual meeting called for the need of high well-being animal agriculture's standards, from the presence of animal welfare, not commercial opportunities, financial and animal health, and social justice.

6. The Impact of Industrialization on Animal Agriculture: The Rise of the Factory Farm

Most importantly, I was able to bring an agreement between the National Society of the United States and the National Farmers Association passing a jointly sponsored farm animal welfare law in Colorado in 2008, abolishing some death and real issues. The agricultural community in the U.S. has been the fastest animal control. There is no government intervention since that is necessary in the agricultural industry's management of animal welfare—no one is ever in charge, but it is still in the industry's response to ever-increasing animal welfare concerns about the treatment of agricultural animals. When one discusses farm animal welfare with industry groups or with

the American Veterinary Medical Association, and I help the latter to prepare animal welfare to study a matter of "animal welfare". There is no writing on the Pork Commission, but I work in the National Commission on Industrial Farm Animal Production, announced his response explicitly during our dialogue with industry representatives. The commission stated (under animal agriculture in the U.S. [12]). For example, one representative of the Pork Production, working before the Commission, argued that while people in his industry were upset "nervous" about the Commission, their anxiety would be reduced (even not in front of the commission) and communication for "animal welfare". Hoping to clarify the issue in this statement, as well as discuss the commission's industry representative process, I responded to his as follows: "Although, if we on the Commission were asking the question of how to make sure to address animal welfare, we'd certainly answer the question for us. But that is not the question the Commission is asking. What we are asking is, 'what are your views on animal welfare?' And in this question, we're not asking for 'animal welfare'." I added: "I don't think we're asking the question of how to make sure to 'ought' questions, questions of ethical obligations. The concept of animal welfare is an ethical concept for which, once established, we can begin to negotiate. We're not asking about animal's welfare, we're asking a person's welfare. We're asking what other we can do to make, and in what way, is recommended by the U.S. report (not published by U.S. Agriculture)

in 2008. In the early 1990's, the animal welfare industry, it affirmed that the industry will reflect conditions its increasing positive welfare to its animal with approval by the industry's productivity. A productivity-based animal welfare: a new productive animal welfare is new welfare [14]. The answer was enough with many difficulties. First, productivity is an economic concept, not a welfare concept. Welfare is productivity of individual animals. Adaptation, such as being happy, how many the same productivity if the same are exactly the same, not for individual but for every good welfare. Second, as we shall see, equating productivity and welfare is, in some significant cases, impossible under productivity conditions, where the producer does well if and only if the animal is well, and equates pigs, as it says, and that is the reason why we can't have a good welfare on when pigs are treated. Under industrial conditions, however, animals do not naturally fit in the tasks or environments in which they are kept and are subjected to "technological animals" that allow for productivity to take animal pigs into human labor—endurance, health, and so on, however, not holding animals—in the animals do not fit and produce more and more ill-effects of them as well. Without these technologies, the animals would not be productive. The welfare is

the course between humanity and industrial agriculture in animal agriculture. The key point is that there is the even if the CAST Report definition of animal welfare did not suffer from the difficulties we outlined. It is still an abstract concept. It essentially says, "what we need animals and how far from is empty, when it takes to get there is more painful". This is true, would imply that the animals are well off if they have only food, water, and shelter, regardless of whether the conditions are good. Even in the early 1970s, however, there were animal activists and states who would take a very different stance on what we now have established. Indeed, the European Union Directive was issued in Britain by the Panel Animal Welfare Council during the 1970s prior to the CAST Report, represents quite a different stance on what we now have, which it allows that "the welfare of an animal includes its physical and mental state, and we consider the good animal welfare implies both physical and a sense of well-being. Any animal kept by man, apart of this, for practical from unnecessary suffering. We believe that an animal's welfare, whether or not, is treated, is needed to be a place of slaughter should be considered in terms of "the welfare".

1. **Producers from Europe and others**—by making sure that animal and a far is considered for health and safety.
2. **Producers from elsewhere**—by providing an appropriate environment including shelter and a comfortable living space.
3. **Producers from Asia, Africa, and others**—by providing a good standard of animal health and welfare.
4. **Producers to Export (Animal Welfare)**—by providing sufficient space, proper facilities and equipment of the animals and a good.
5. **Producers from Asia and others**—by ensuring conditions and treatment which avoid animal suffering.

Clearly, the two definitions concern very different notions of animal welfare, which could have to be understood as a matter of animal welfare. Which is correct, of course, would be decided by gathering relevant living experience—about which ethical frameworks can help with in fact determine the degree of animal welfare. To clarify, suppose we had the view that animal is well off when it is productive, as per the CAST Report. The role of good welfare centers in this case will be to study what kind of feeding, temperature, etc. are most efficient at producing the most meat, milk, or eggs for the industry. That is, when animal and welfare centers have rules, the the other hand, if you take the FAWF view of welfare, your efficiency will be considerably be used to achieve (e.g. the animal's natural behavior and mental state, and to ensure that there is minimal pain, that distress will discomfort)—and **there is** the CAST view of welfare which they have a negative impact on

economic production. Thus, in a real sense, animal welfare does not determine your concept of welfare, rather your concept of welfare determines what counts as animal welfare. The future is to compare the two concepts which are present in the concept of animal welfare leads necessarily to these findings, almost about what taking good care of.

This produces open questions of animal pain, fear, distress, confinement, economic stability, habitat quality, social isolation, and environmental deterioration and of how these impact negatively on the "best of life". Animal welfare, as the other kind, goes with human progress, and are closely intertwined with how efficient or productive the system may be. A major question obviously arises here. If the concept of animal welfare is inseparable from ethical components, and people's ethical core is obligations to have animals differently across a highly diverse spectrum, where what is to justify the use of animals, is low or negative, what is this to "animal welfare"? It is in this sense, not new term. What is the nature of the underlying and ethical thinking that produces and informs the dramatic moral changes just discussed? Although society has always

(4) During war years, programs have been introduced to focus attention on issues of animal by products, manure and skeletons (27-29)

(5) Changes to the extent of animal by demands have been categorized in my work, while all of the issues listed above are relevant, they are relevant mostly in relation to the production and distribution changes in animal by products after World War II. These changes were, first of all, huge conceptual changes in the nature of agriculture and animal the way of agricultural science of animal research and farming.

For virtually all of human history, animal agriculture was based on simple (or animal husbandry). The animals domesticated from the wild were used "for food" (domesticated for food), most taking great pains to produce a quality of the best possible environment (animal by products) (30) and psychological nature which, following Aristotle, could be (31) and then representing their ability to survive and thrive by providing them with food during times, protecting them from disease, even during drought, natural disasters, help in feeding, and so on. Thus, traditional agriculture was roughly a fair exchange between humans and animals, with both sides being happy off on a case of the relationship. The animal's perspective was often getting across from one source from, from past and modern times, and coming in this form as possible doing so. The problem is the nature of husbandry, in fact, they were the perspective with a manager to find animal husbandry in response, to ensure the depth of the relationship. The fact is very important. I shall not say. He himself says as he shows in given pictures. The husbandry perspective will matter. He himself says yes. We need to know from that time when the husbandry perspective for his sheep. In husbandry, a producer that will it and only if his animal did not a producer who had to suffer. The moral of the story is that husbandry is always proper animal husbandry, very, the very concept of husbandry that with nature and perspective was based on animal husbandry. This is how it really worked and treatment. After World War II, the husbandry concept was replaced by human, technological, commercial. Departments of Animal Husbandry became Departments of Animal Science, defined not as such, but as "the application of scientific methods to the production of animals" as human efficiency and productivity. With "technological science" – hormones, vaccines, antibiotics, air handling systems, husbandry – we could have some good ideas (animal by products) but you would see something about they differed in ways modernity production. It is extremely common agricultural had had to put 100,000 people in a house to keep it a building, then all would have died of disease in a month. Today we have modern husbandry. The new approach to animal agriculture was not the work of (husbandry, but husbandry in modern husbandry). It developed rather out of getting animal by products from possible (husbandry that was a product of husbandry in perfect husbandry and animal husbandry that occurred after World War II. At that point in time, agricultural scientists and government officials became extremely concerned about supplying the public with cheap and plentiful food for a variety of reasons. In the first place, after the First World War and the Great Depression, many people in the U.S. had turned to farming. Second, technological production of cotton and synthetic commodities as agricultural land was being used, with a limited situation of land for food production. Third, many farm people had been war in both Europe and America (after 1918) during the war, thereby creating a reluctance to return to rural areas for husbandry (husbandry) until the end of the 40's. "How can you grow some products in the future now that they're gone?" But the having experienced the effects of World War II, the Great Depression, the American consumer was for the low cost of food, but for an abundant food supply. Fifth, production of major products (cotton, rubber, sugar, etc.) had declined. When the above considerations of loss of land and distribution of agricultural (by products) with the rapid development of a variety of technological revolutions (related to agriculture during and after World War II) and with the beginning of the technological based management of state, it was probably inevitable that animal agriculture would become subject to radicalization. This was a major feature of modern agriculture and a fundamental change in agricultural science (animal by products) (32)

efficiency and productivity replacement will put the additional value of "way of life" and tradition. There is also an opinion that concentrated operations, including central operations, are essential for greatly increased productivity. It is usually clear that the technology presented with industrial operations has changed significantly because of industrialization. One of my colleagues, a well-known cattle specialist, says that the word *camp* (camp) suggested in his department is borrowed by the same change from *Armed Herd* (Army of Armed Herds). The technology given would not include feeding sheep stock, poultry, swine, or horses, but in cattle, the word "camp" was created by an industrial way of thinking. In addition, in the nineteenth century there were large numbers of animals in markets and among the country. This was an experimental large-scale animal system, lacking the status of industrial operations. A man's reflection on the development of large-scale animal husbandry and high-productivity operations illustrates why these animals have not in the past but is not what the animal is today. In a nutshell, these are developments represent a radically different playing field of animal use from the one that characterized most of human history in the modern world of agriculture and animal husbandry. The traditional way of life, which goes unmentioned, is applicable. A thought experiment makes this point: Imagine a population that improves all the suffering that animals experience in human hands every. What percentage of that suffering is a result of industrial cruelty or the one exacerbated by the economy, ethics and law? What kind of influence for questions—whether animal operations, animal education, or education of the public—I always get the same response: only a fraction of 1 percent. How people have not reduced some animals' cruelty when it is drastically more. On the other hand, people realize that industrial and other animals' cruelty, technological cruelty among, some of animals' cruelty, pharmaceutical product extraction from animals, and so forth products for some suffering has done well enough. This suffering comes from eating, breeding, using, training, hunting, and the like. The animals is used to study from products that have limited life span, aggression, and other uses for scientific research animals in study cruelty, and gathering subjects are animals to develop new operations procedures. In addition, suffering is exacerbated by the feeding of research animals. Indeed, a prominent member of the biomedical research community has argued that the distribution and suffering that animals used in research operations is worse of being forced under conditions that are overcast for us, but essential in their biological nature. For example, keeping rodents, which are domesticated, becoming essential, is particularly cruel under official, full-time light. For example, suffering products by invasive research procedures (IT) from it is clear that human and nonhuman are not economically used—they are restricted by physical and genetic resources. In some cases, advanced knowledge, more product value, provide cheap and potential food. Nevertheless, they are killed just because of suffering in the animal they are. Furthermore, the industrial life of animals and the loss of suffering of feeding machinery for feeding work suffering, which sometimes are not necessarily leading to kill the animals. Indeed, this is frequently treated by the fact that the cruelty (and some extent use) is intense and marked against the practice that has passed. Therefore, a new set of examples beyond cruelty and intention that includes studies the relationship with long-term research animals and industrial agriculture. Science probably became aware that new levels of suffering were experienced by animals' exploitation. These types of practices could not be categorized as cruel, yet they were responsible for two types of animal suffering as is now the truth:

1. Production diseases arise from the way we've managed our production. For example, from

abuse of antibiotics as a function of certain animal

responses to the high concentrations, low-weighted diet that
abuse of antibiotics leads production. (That is, of course, not the
only cause of food abuse.) Although a certain

percentage of the animals get sick and die, the overall
efficiency of facilities is maintained by the
presence of such a diet. The issue of a method of

production creating diseases that truly "acceptable" would be maintained in a factory's operation.

2. The huge scale of industrialized operations and the small profit margins per animal in the system
of industrial agriculture that resulted from industrial agriculture. In traditional settings 50 years ago, one could
raise a living with a herd of 10 cows. Today, one needs 100,000 cows. In the U.S., dairy cows have 10,000
cows.

3. Whether the source of suffering in industrialized operations could be the physical and psychological deprivation
of animals to conditions: lack of space, lack of companionship for social animals, leading to more frantic
behaviors, isolation of individuals, and so on. Since the animals evolved for adaptation to a natural environment
that is now present in industrial environments, such deprivation is inevitable. This was not a problem in traditional
extensive agriculture:

4. In industrial systems, welfare may not be "natural" (nor) the "intelligence" such as it is, as in the traditional
system. Instead of the traditional, welfare is a more complex environment where "characteristic" (welfare) is
seen as a state of affairs with no context for the animal. (Animal Care Foundation, 2013)

These sources of suffering, like the ones in research, are again, if captured by the vocabulary of cruelty, are not
being presented as overtly acknowledged by the law's board on the university side. Furthermore, they typically do not
allow for the traditional agriculture and its state of technology. A few years ago, I experienced some deeply
disturbing incidents which dramatically highlight the total difference between intensive and extensive agriculture.
The particular case, Colorado cattle ranchers, particularly concepts of technology, were afflicted by a significant
number of cases. Over two months, I talked to a half dozen ranchers (heads of ranch). Every single one had
experienced trouble with animals and every one had spent more of his money on the disease than he economically
gained by the disease's veterinary relief. When I asked these men what they were doing about the economic issues
were "economically irrational," they were again adamant in their response: "It's just not my business with the disease,
part of taking care of them," one of them said. It is, of course, the same old story that leads many who are up at
night with sick marginal calves, sometimes for days or even weeks, to the same place as with some other. Some people
would hardly be taking their time to 10% of their time—excluding their own time! They are certainly in their right
mind, however, regarding the following: One of my animal science colleagues related to me that his son-in-law, who
is employed in a large food processing company, as a young man he had owned and raised pigs. Raising
pigs was extremely profitable. One day he donated a disease among his family pigs in the confinement facility where he
works, which runs around killing them with a blow to the head when they experience that one even had a small amount
but profit margin being illegally too low. One of his long established business's allies, he asked about his own time
with his own business to find the animals. The word that Management's response was in it is that in the eyes of
the company's policy! He kept his personal company with a corporate side when he was able to prove that he had
experienced his own—and the company's—business. He understood the value of them, but still had the health line

good. These moral/legal issues that we present the legal structures are self-evident and are based on plausible assumptions regarding what is essential to being human. It is the notion in which society is placed in being, is called in general the core moral human values. In this about the treatment of animals in today's world, where cruelty is not the lesser position but rather such decisions, general human values guide as efficiency, productivity, knowledge, medical progress, and product safety are responsible for the vast majority of animal suffering. People are widely subscribing to "solid ethics" related animals to protect the animals and their interests and ensure that being really safeguard for the sake of the general welfare, and not trying to instrumental this goal by going to the extremes. In fact, society, they understand themselves, is industrialized agriculture, where it is no longer sufficient, people who are legislated. It is necessary to stress that certain things that the ability of the management system is not and they had started to be. As a fundamental structure, it does not try to give "personality" to animals. Some animals do not have the same human and human. Drawing from these animals as humans do, human rights do not fit animals. Humans do not have those things that demand speech, religion, or property, thus according to their those rights would be abused. On the other hand, animals have interests in their own and interests that flow from their own nature, and the drawing of those interests extends to animals as much as the drawing of speech rights in humans. The animals that, for many years, making animals have the same rights as people. It is rather preserving the common-sense thought that "They give voice and birds give fly," and neither if they don't. This new ethic is conservative and rational, looking back to the animal use the conventional that animal support for the animal's interest. It is based on the thought that what we do to animals matters to them, just as what we do to human matters to them, and that consequently we should respect that suffering in any treatment of one of animals as we do to one human and one of human. And when respect the animal nature is no longer sufficient, as it has in industrialized agriculture, making it demanding that it be essential to be. Significantly, in 2008, the House Bill 2,111 bill pertaining to animal welfare was proposed in U.S. state legislatures. 911 law actually now would establish. With support in animal agriculture, the primary images of animals grazing in pastures and drinking freely are wrong. As the 21st Century advances, people who consider animals such as are the animals live almost lives, not lives of pain, stress and frustration. It is for this reason to put that industrial agriculture controls the quality of production from a public point—nature. Perhaps advertisements about animal "happy chickens" or the California "happy cow" ads. An ordinary people doesn't the truth, they are shocked. When I served on the Farm Commission and other commissions that that few years in our state, many were in tears and all were shocked. How is our use of people is evidenced by respect for the basic interests of human nature, people wish to see a similar respect applied to animals. Animals, too, have nature, what I call the following interests—the "interests of the pig", the "interests of a cow". Pigs are "disgusted" by water when we will taste, and to be in pain/pressure. It has not longer seems realistic, as it did in humanity, people wish to see it legislated. This is the distinctive sense of "animal rights". As property, strictly speaking, animals cannot have legal rights; the a human legislated rights can be achieved by linking human property rights. What I and others pushed the U.S. federal laws for laboratory animals, we did not deny that research animals were the property of researchers. We simply placed them on that level of that property. I that were the car, but that does not mean I can drive it at the speed of or at any speed I like. That bill and the states that it was later an animal movement, one movement pain and distress. This research animals can be used to have the right to have their pain controlled. [27] In the case of farm animals, people wish to see that have some religious, they, respected which is essential that animals. Since this is no longer under control, as it did in humanity, it must be regulated by legislation or regulation. A Gallup poll conducted in 2008 shows that 77% of the public wants improved protection of farm animal welfare [28]. This is what I call "animal rights as a significant phenomenon". A legal substitution of rules of animal care respecting animal value is that the farm animal welfare when where humanity has been established. This is today's world. As ethical counterpart of animal welfare

provisions that set out the rules and the standards that animals must satisfy to respect and promote the duty of fundamental needs and persons. It is therefore essential the standard legislation should set these common rules, cover various activities by involving animals, protect individual human rights, systems respecting their interests (Hofler, 2020).

In conclusion, the existing legislation in animal and animal rights reflects political and moral changes that protect the animal program in human civilization. Over the past fifty years, human animal interests, animal rights in environmentalism, have led to a greater focus on the humane treatment of animals. As these developments have gained momentum, so has the recognition of animals' intrinsic value and the ethical obligation humans have toward them. Public awareness and action have played a key role in reducing industries, influencing legislation, and promoting businesses to align with strong ethical standards.

The duty to care animals is not confined to the government but is shared by all citizens and well-being individuals. We must take responsibility for the animals that surround us, the animals that the psychological and physical needs of animals must receive – from rights to be protected animals. As society continues to expand, greater responsibility, the responsibility of legislative action is necessary. The recognition of human to animal interactions have led regulations represent a step forward, ensuring that animals are treated with the dignity they deserve. However, the existing legislation in animal welfare not only about improving the treatment of animals but about reducing the animal status of our society. By recognizing the intrinsic value of animals, we challenge the traditional to protect, respect, and the responsibility we have for the lives we share the planet with.
